IMPORTANT NOTIFICATION

Applicant

THOMSON LICENSING S.A. et al.

- The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary report on patentability and its annexes, if any, established on the international application.
- 2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
- 3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary report on patentability. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

The applicant's attention is drawn to Article 33(5), which provides that the criteria of novelty, inventive step and industrial applicability described in Article 33(2) to (4) merely serve the purposes of international preliminary examination and that "any Contracting State may apply additional or different criteria for the purposes of deciding whether, in that State, the claimed inventions is patentable or not" (see also Article 27(5)). Such additional criteria may relate, for example, to exemptions from patentability, requirements for enabling disclosure, clarity and support for the claims.

INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY (SEPARATE SHEET)

Re Item V.

The following documents are referred to in this communication, the documents D5 was not cited in the international search report.

- D1: CHRISTINA GOMILA, ALEXANDER KOBILANSKY: "SEI message for film grain encoding" JVT OF ISO IEC MPEG AND ITU-T VCEG JVT-H022, 23 May 2003 (2003-05-23), pages 1-14, XP002308742 GENEVA, SWITZERLAND
- D2: SCHOYER M K N ET AL: "Block position dithering in DCT-coded sequences" SIGNAL PROCESSING. IMAGE COMMUNICATION, ELSEVIER SCIENCE PUBLISHERS, AMSTERDAM, NL, vol. 8, no. 6, September 1996 (1996-09), pages 545-549, XP004047116 ISSN: 0923-5965
- D3: US-A-5 450 098 (OZ RAN) 12 September 1995 (1995-09-12)
- D4: J.-R. OHM: "Digitale Bildcodierung, Statistische und Inhaltsorientierte Bildmodelle (Kapitel 4.1-4.2)" 1995, SPRINGER-VERLAG, BERLIN HEIDELBERG NEW YORK, XP002309350
- D5: GISLE BJONTEGAARD: "Addition of comfort noise as post processing" ITU-T SG 16, Video Coding Experts Group, Document Q15B15, 8 September 1997, pages 1-2, XP002319278, SUNRIVER, OREGON, USA

1 CLARITY

Please note, that for some expressions in the claims it is not clear to which features they relate, thus they are not considered during the following examination. These expressions are set in square brackets throughout this written opinion.

2 INDEPENDENT CLAIM 1

The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 1 is not new in the sense of Article 33(2) PCT.

Document D1 discloses (the references in parenthesis applying to this document):

A method for reducing artifacts in a video stream

(D1: page 2, paragraph 2 and 3, wherein the artifacts are the missing film grain in the decoded images; please note, that any difference between the original input image (including film grain noise) and the decoded output image (with reduced film grain noise) can be seen as a coding artifact, thus the addition of film grain noise to the decoded output image is a method for reducing these artifacts),

comprising the steps of: decoding the video stream

(D1: figure 1, "Decoding");

and adding noise to at least one pixel in a picture in the video stream following decoding

(D1: figure 1, "Film grain simulation" with page 3, section "film grain simulation (decoder)" and page 5, lines 13-15, including equation 1) in an amount correlated to additive noise of pixels in at least one prior picture

(D1: page 5, lines 22-26 and page 6, lines 6-11 including equation 3: with a temporal correlation factor v. Thus, the noise to be added to a pixel in the current image G(x,y,t,L) is correlated by a correlation factor v(c,L) with the noise G(x,y,t-1,L) added to a decoded pixel in a previous decoded image at time t-1 and with intensity L.).

3 INDEPENDENT CLAIM 11

The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 11 is not new in the sense of Article 33(2) PCT. Compared to claim 1 only the feature of "in an amount correlated to additive noise of pixels in at least one prior picture" is replaced in claim 11 by "in an amount correlated to additive noise of at least one other pixel in the picture". Document D1 discloses this feature as well (D1: page 5, lines 22-36 including equation 2: with spatial correlation factors q, r, s, correlating the noise added previously to neighbouring pixels to the noise of the current pixel).

Document D5, which has been added by the Examiner, discloses all the features of claim 11 as well (D5: whole page 1, wherein the comfort noise value (I_2) added to a current pixel is correlated to the noise added to pixels at position current-2 by the value R_2).

4 INDEPENDENT CLAIM 12

The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 12 is not new in the sense of Article 33(2) PCT.

Document D1 discloses (the references in parenthesis applying to this document):

A decoder arrangement for decoding a coded video stream to yield reduced artifacts, (D1: page 2, paragraph 2 and 3, wherein the artifacts are the missing film grain in the decoded images)

comprising: a video decoder for decoding an incoming coded video stream to yield decoded pictures

(D1: figure 1, "Decoding")

a reference picture store for storing at least one previously decoded picture for use by the decoder in decoding future pictures,

(D1: page 8, paragraph 4 and 5 "JM6.1a encoder" settings with "Number of reference frames: 2", thus the used corresponding decoder must have (implicitly) a reference picture store as well, if it will be able to decode the bitstream)

a noise generator [noise] for generating noise for addition to at least one pixel in a decoded picture

(D1: figure 1, "Film grain simulation" with page 3, section "film grain simulation (decoder)" and page 5, lines 13-15, including equation 1)

in an amount correlated to additive noise of at least one pixel in at least one prior picture;

(D1: page 5, lines 22-26 and page 6, lines 6-11 including equation 3: with a temporal correlation factor v. Thus, the noise to be added to a pixel in the current image G(x,y,t,L) is correlated by a correlation factor v(c,L) with the noise G(x,y,t-1,L) added to a decoded pixel in a previous decoded image at time t-1 and with intensity L.) a summing block for summing the noise generated by the noise generator with a decoded picture from the decoder

(D1: "+" in equations 1, 2 and 3);

and a clipper for clipping the summed noise and decoded picture.

(D1: a clipper is (implicitly) present in the scheme of D1: Since Gaussian noise of predetermined variance, i.e. without restriction to the maximum value of the noise amplitude, is added to the decoded pictures, it would have led to strong visible artifacts in dark and light regions of the output images, if they had not been clipped.

As no such artifacts are visible in the images of figure 8 in D1 a clipper was used)

5 INDEPENDENT CLAIM 20

The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 20 is not new in the sense of Article 33(2) PCT. Compared to claim 12 only the feature of "for addition to at least one pixel in decoded picture in an amount correlated to additive noise of at least one pixel in at least one prior picture" is replaced in claim 20 by "in accordance with decoded pictures and bit stream information from the decoder for addition to at least one pixel [in decoded] in an amount correlated to additive noise of at least one pixel in a prior picture". Document D1 discloses this feature as well (D1: page 5, lines 7-15 including equations 1 and 3 with L representing the dependency of the added noise G(L) on the decoded images and "SEI parameters" being the bit stream information, page 6, lines 6-11 and equation 3: with temporal correlation factor v correlating the noise added to a previous picture t-1 to the noise of the pixel in the current frame t).

6 INDEPENDENT CLAIM 27

The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 27 is not new in the sense of Article 33(2) PCT.

Compared to claim 12 the feature of

"for addition to at least one pixel in decoded picture in an amount correlated to additive noise of at least one pixel in at least one prior picture" is replaced in claim 27 by

"for addition to at least one pixel in a decoded picture in an amount correlated to additive noise of <u>pixels</u> in a prior picture".

Furthermore, the additional feature of claim 17 is added in claim 27 as well:

"including a noise picture store for storing the noise information for subsequent use by the noise generator.

Document D1 discloses these two features as well (D1: page 6, equation 3 wherein noise for addition to two pixels G(x,y,c,t,L) and G(x+1,y,c,t,L) is correlated to additive noise of two pixels in a prior picture G(x,y,c,t-1,L) and G(x+1,y,c,t-1,L). Furthermore,

a noise picture store is implicitly used in the temporal recursive noise generator of D1, equation 3, because, without such a memory, for every pixel the whole recursive noise calculation starting with the first image up to the current one had to be performed again and again which would have let to an enormous increase of the computational complexity. Furthermore, it is the nature of a recursive formula to reuse already calculated values which, therefore, have to be stored.).

7 INDEPENDENT CLAIM 32

The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 32 is not new in the sense of Article 33(2) PCT. Compared to claim 12 only the feature of "in an amount correlated to additive noise of at least one pixel in at least one prior picture" is replaced in claim 32 by "in an amount correlated to additive noise of at least one pixel in the picture". Document D1 discloses this feature as well (D1: page 5, lines 22-36 including equation 2: with spatial correlation factors q, r, s, correlating the noise added previously to neighbouring pixels to the noise of the current pixel).

- NOVELTY, DEPENDENT CLAIMS 2,3,7,9,15,17,18,24,25 AND 30
 Dependent claims 2,3,7,9,15,17,18,24,25 and 30 do not contain any features which, in combination with the features of any claim to which they refer, meet the requirements of the PCT in respect of novelty and inventive step (Article 33(2) and (3) PCT), see documents D1-D5 and the corresponding passages cited in the search report.
- 9 INVENTIVE STEP, DEPENDENT CLAIMS 4-6,8,10,13,14,16,19,21-23,26,28,29 AND 31
 Dependent claims 4-6,8,10,13,14,16,19,21-23,26,28,29 and 31 do not contain any features which, in combination with the features of any claim to which they refer, meet the requirements of the PCT in respect of inventive step (Article 33(3) PCT), see documents D1-D5 and the corresponding passages cited in the search report.

INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY (SEPARATE SHEET)

International application No.

PCT/US2004/025366

10 CLAIMS 1-32

Claims 1-32 disclose methods and apparatus for video decoding and post-processing applications. Therefore, the subject-matter of these claims is considered to be industrially applicable according to Article 33 (4) PCT.

10/566881

IAP20 Residentiatio 02 FEB 2006

1	1. A method for reducing artifacts in a video stream, comprising the steps of:		
2	decoding the video stream; and		
3	adding noise to at least one pixel in a picture in the video stream following decoding in		
4	an amount correlated to additive noise of pixels in at least one prior picture.		
1	2. The method according to claim 1 wherein the at least one prior picture		
2	comprises a previously displayed picture.		
1.	3. The method according to claim 1 where the at least one prior picture comprises		
2	a previously decoded picture		
1	4. The method according to claim 1 wherein the amount of noise is correlated in		
2	accordance with a correlation factor α having a value such that $0 \le \alpha \le 1$.		
1	5. The method according to claim 1 wherein the amount of noise is correlated		
2	using an instantiation of a Finite Impulse Response (FIR) filter.		
1	6. The method according to claim 1 wherein the amount of noise is correlated		
2	using an approximation of an Infinite Impulse Response (IIR) filter.		
ı	7. The method according to claim 1 further comprising the steps of:		
2	extracting bit stream information from the video stream; and		
3	determining strength of the added noise in accordance with the bit stream information.		
I	8. The method according to claim 7 wherein the bit stream information comprises		
2	a quantization parameter.		
1	9. The method according to claim 1 wherein the added noise is Gaussian noise.		
l	10. The method according to claim 1 wherein the added noise is Laplacian noise.
